TURKEY FATTENED ON RANGE

Flash Chick in Flavor and Tenderness in Way It Cannot Be Fattened in a Pen

It is just as important to have turkeys in good pinup condition before marketing as it is in chickens. However, a good many farmers regard this as a hard job simply because there is considerable misunderstanding as to the correct way to go about the matter.

Turkeys, if taken care of as usually fattened; in fact, under such other evils. But if turkeys have had free range all summer, they cannot fatten them with any satisfaction in a pen. The change will cause them to fatten and refuse to eat and thus they will lose weight of gain weight. On the other hand, if they range too much while being fattened, they will lose weight. The right way is therefore a compromise between these two extremes. Teach the turkeys to range so they are eating; then range at short distances only and coming up even between feeding times, where they should always be able to find some sort of attractive food.

Don't try to fatten the turkeys on corn. A diet of corn and any other results in hounch for the turkeys just as it does for pigs. A sick turkey is usually a dead turkey. Make the fattening rapid; variety of diet and several meals. Daily.

Turkeys Fat and Refuse to Eat
 is in an incubator.
 The parts of a turkey and, of course, make a good ration. Give also an occasional mash feed of equal parts of corn and wheat. A quantity of ground berberis or green cut be used as well.

MAKÉ SUCCESS WITH GESE
 Geese Must Eat Hay Hardest of Feed—Gross in Ratio is Most Important

After geese are a month old they are among the hardest to fatten, but they are rather delicate at first and should have careful attention. The main thing is to keep them warm and dry the first few weeks, feeding them a little at a time and often—say four or five times a day. One of the best rations on which to start geese is a mixture of corn meal and shorts, mixed with bread or cracked corn, half boiled egg chopped, etc.

It is also a good plan to provide some tender grass as a relish right from the start. The grass is usually a young grass, like clover, or alfalfa. Some other grass, along with most scraps, should be added to the ration gradually as the geese grow. Most people get geese in small numbers for the first two weeks so they can't run wild or get so they can't be kept in a pen. The method of fattening geese is gradually increased until the geese are a month old; then they should be turned out to free range where they will find lots of pasture to make good use of.

Geese do not have to have water in the small stream or pond. It is essential that the water have an abundant supply of good drinking water, which they use some freely.

ADDITIONAL tips are turned up again, if the geese is in good condition, they will eat more than twice a day at first and later once a day. The first object

should be to get as large a growth of frame as possible. Let fat come last. The birds receive lots of grass and worms, and graze the same amount throughout that are not exposed to fattening.

As an approach and the grass is gone, the birds should be smothered for a month or the better as to the time fattened. However, as to the month before the holiday selling season, the geese are wanted on the market are few fall they will not get a nice amount of corn and wheat at first and corn alone later. In fitting geese for market it is hardly possible to make them lose too fat an exterior, at least, but do affect upon their table qualities and therefore most people want lots of R—Pars Ltd.

COUNTRY NOTES

The busy has is the one that makes the eggs to hatch.

It says to feed the young birds liberally until they are full grown.

Be kind to your fowls; make friends with them and they will repay you.

Exercise makes the hens lay better, increases fertility and makes the chicks grow strong and healthy.

Make the nest boxes of single wire, but not too deep. If necessary, if large in size, will break the eggs by shaking the nest if it is too deep.

A hen too long brooded soon becomes restless and ungainly. Restlessness results in discomfort and the discomfort of such work as egg-eating, feather-pulling and cannibalism.

HATCHING QUINES IS HARD

Young Fowls Are Tender at First and Must Be Kept Out of Weather

Young chicks sometimes appear to be deformed when first hatched, and at first the appearance is usually owing to the result of a slow hatch. When chicken legs or incubators are used, it is very important to give the eggs proper attention. Quines resist water, especially while sitting. This alone would be sufficient reason for using incubators, although there is still another reason not given. Quines hatch if not controlled will drop the young quines around through the grain in the case of weather, and the result can only be imagined. Of course, young quines need exercise, but they are very tender at first and should be kept out of wet grass by rails. They are far less apt to take gaps if kept dry. It is the same with chicks and turkeys.

During the first few days after quines are hatched they should be fed quite frequently. We feed a little every two hours. They have usually crumbled with a little chopped greens, such as lettuce or collards, which will always give good results. A little coarse sand is sprinkled over the quines to keep them from getting too fat. After they have learned to eat grain whatever they eat first and should be kept out of wet grass by rails. They are far less apt to take gaps if kept dry. It is the same with chicks and turkeys.

RATION FOR YOUNG TURKEYS

Fowls Are Finicky About Food and Refuse Anything Not Already in Their Ration

Young turkeys are very particular about their food and will not usually touch any food that is not already in their ration. For this reason, the articles of food that they will touch from the first. Do not feed until the small amount of food that they will touch. They are very careful not to overfeed.

A satisfactory first feed is a small amount of cracked corn, mixed with bread or cracked corn, half boiled egg chopped, etc. It is also a good plan to provide some tender grass as a relish right from the start. The grass is usually a young grass, like clover, or alfalfa. Some other grass, along with most scraps, should be added to the ration gradually as the geese grow. Most people get geese in small numbers for the first two weeks so they can't run wild or get so they can't be kept in a pen. The method of fattening geese is gradually increased until the geese are a month old; then they should be turned out to free range where they will find lots of pasture to make good use of.

POULTRY NOTES

The busy has is the laying hen.

The less accurate market fowls get the more quickly they will fatten.

When milk is used as the sole drink for chickens on other animal protein is necessary.

Most of the losses of baby chicks is due to the fact that they are improperly fed during the first few days.

Most scraps and also tankage will help fill the crop faster. Add 10 per cent of alkali to the grain ration.

Breeds or falls in the turkey brood, none depends largely on the selection of breeding stock. Health and vigor should be the first consideration.

A good layer may be described as one that will lay such an amount of eggs, an intelligent brood, good capacity, high level of fat, a soft pliable skin, and will lay often.

Horticultural Facts

TIME TO PRUNE FRUIT TREES

Average Farm Should Not Be Trained Until Middle of March or April.

Many people desire the most of the best results from pruning of their orchard trees by doing it at the best season of the year. The highest effort of pruning from improper selection of time to do the work often offers the most to be gained from the pruning of the trees.

Of course, when one has a large orchard it is not necessary to prune the entire orchard the work before it would be advisable on smaller plantings to prune the trees in sections and it might not be able to go through the orchard before it was too late in the spring.

The large orchard, no choice of time can be made because the pruning of a few acres would require practically a month's time if one hours per day.

Well-Pruned Windsor Cherry Trees—Both Trees May Be Sprayed More Early and Are Less Subject to Disease and Insect Attack Than Neglected Trees.

Day were spent in the work. One had to start in the winter in order to get through before the snow commenced to rise in the spring.

Pruning the orchard, however, the average farm orchard of an acre or less in size, the pruning should be done in the middle of March, just before the snow commences to rise. It is a good time to start to work on the trees, as the old adage of "when your knife is sharp and you are so inclined, it is the best time to work."

Women made earlier in the season as in December and January start heating several weeks later because the cold drying winds have killed the exposed layers of cells in the growing tissue.

Many authorities agree that the time of pruning is not so important as the manner in which it is done. The cuts should be made with a sharp knife or saw and close to the remaining branch. Such cuts are best promptly and thoroughly, while jagged cuts are best avoided. It is not best to cut at all, neither at what season of the year they are made.

TO SAVE BORDERS MIXTURE

Oregon Experiment Station Finds Aid of Little Sugar Will Preserve Material.

Fruit growers who use borders mixture are well acquainted with the fact that the material that is left in the tin after slight, or which for some reason may not be standing for a considerable period, loses its effectiveness. A great deal of waste is occasioned by this inactivity of borders mixture. But at the Oregon Experiment Station it has been found that a little sugar put in the borders mixture will increase all its effectiveness. Borders mixture thus treated can be held an indefinite length of time and the same as freshly made. This method will save the way for better use when rain or breakdown prevents the grower from finishing up his batch.

In the course of the investigation it was found that the quantity of sugar to use is one-half ounce of ordinary granulated sugar for every ounce of borders mixture used. At the rate of one mill would be not harmful, but not necessary. The use of water and the use of solution at the rate of one-half pint for every pound of borders mixture. In other words, a rounded tablespoon of sugar dissolved in a quart of water is sufficient for 50 gallons of 4-6-0 borders mixture.

STUDY MANY FARM PROBLEMS

Bell, Corp. Animal Disease, Management, Feeds and Other Matters Being Worked Out.

There are 140 different farming problems now being studied or being worked out by the United States Department of Agriculture, said the state or general agent. These studies are being carried on by the state or general agent, animal disease, farm management, feeds and other matters.

Helps Fish Flavor. You will improve the flavor of fish if you apply the following to the fish when it is fresh.

VENTILATED BOX FOR BREAD

Hot Product Should Not Be Wrapped Immediately as Moisture Causes Molds to Form.

Bread and cakes should be kept in a ventilated box. The United States Department of Agriculture reports that the use of airtight boxes for bread wrapped immediately causes molds to form. The bread will become soft and moist, will ripen, and rot.

Crackers and cookies, on the other hand, lose their crispness, by absorbing moisture from the air. This should be kept in airtight boxes wrapped in waxed paper or paraffin paper if possible.

Helps Fish Flavor. You will improve the flavor of fish if you apply the following to the fish when it is fresh.

A good spray used not only saves the fish but also makes it more palatable and more tender.

HOW TO GET RESULTS IN BUYING PATTERNS

Useful Suggestions Offered by Department of Agriculture to Club Members.

(Prepared by the United States Department of Agriculture.)

The United States Department of Agriculture offers to members of the various clothing clubs the following suggestions on using commercial patterns.

In buying a pattern, be sure that it is about the right size. A pattern bought by age or by measure. For a girl of normal size, the pattern for a pattern by age; for an adult, or a girl who may vary from the norm, take the necessary measurements and buy a pattern that corresponds to them. Buy patterns as numbered according to bust measure; skirt patterns are numbered by both bust and waist measure.

It is better to buy a skirt pattern of the correct hip size, as it is easier to make slight changes in it around the waist than to alter it in the body.

Before opening the pattern, read the directions carefully and thoroughly. Use the pattern and study the separate pieces. A guide chart is usually printed on the envelope and will show you the purpose of the various pieces. Put back into the envelope any pieces which are not to be used at once.

To lengthen a pattern for a waist or skirt, cut straight across each of the pieces that are too short, leaving the ease exactly perpendicular to the line of dots which marks the lengthwise line of the goods. Insert a piece of paper as wide as your waist with the pattern to be made longer, or, when cutting out the garment, lay the two cut ends of the pattern on the goods so that they are separated by a distance equal to the desired increase in length.

When lengthening a skirt pattern, the pieces should be placed above the waistline of the distance from the waist to the hem. In a waist make the cut about three inches above the waistline. To increase the width of a piece, lay the pattern flat and separate the pieces at the same distance as its lengthening.

Another way of making a garment longer or broader than the pattern is to put a pleat evenly in the goods, lay the pattern over it, and cut. To shorten a pattern or make it smaller, make a pleat in it in the same position as suggested for the slashes.

Spread the material out on a flat surface and arrange every piece of the pattern on it in the required order. As many of the pieces are to be cut in duplicate, you can often save time by cutting the material on it, and cut the two pieces at once. In cutting the back of a waist or the front piece (and sometimes the back) of a skirt, fold the material lengthwise along the straight edge of the pattern along the fold cut around the pattern except on this straight edge.

When it is cut in this way, the negative fold are marked on the pattern with crosses, or in some other way.

Sometimes the guide chart indicates how to arrange the pattern. Be sure the goods so that there is no unnecessary waste in cutting. In any case, lay the pattern on so that the pieces are cut in the same position as suggested as far as possible. Be very careful that the length of the pieces (especially the pattern) is upon the wrong (reverse) side of the goods. Directions are usually given on the envelope and on the label.

Pin each section of pattern in several places, taking care that the curves and corners are flat on the goods. Mark out the pieces, allowing for ease. If allowance has not been made for them in the pattern; otherwise cut exactly around the edge. Do not straighten, cut a short, sharp, close. An arrow cutting in the greatest length will give a good-looking pattern. Cut all notches as indicated by the pattern, using small scissors and being careful not to cut them too deep. Mark corners and notches with small sharp-pointed pins. Turn the paper pattern, and fold all pieces carefully, and place on one side of the goods.

The calculations of the amount of material to buy in the case of garments are more elaborate. Most commercial patterns give a quantity of material of different widths necessary for a garment. If the amount of material is not estimated, taking into consideration the measurements of the pattern and of the person who is to wear the garment.

GOOD REASONS FOR PRUNING

First Object Should Be to Remove Dead, Broken or Decayed Branches—Cut Over Pruning.

There are five reasons for pruning fruit trees. The first object is to remove the dead, broken or decayed branches. The second object is to remove the annual growth so that the main or permanent growth may be allowed to branch may be removed to prevent overcrowding of limbs or the thickening of the tree to future years. Pruning and heading in every year prevent the spread of infectious diseases. One of the foremost purposes is to cut down the annual growth to reduce the crop in proportion to the capacity of the tree.

Attending Trees in Orchard. Most orchards can't be taken in during the winter, but it is not so. This spent on this will save a lot more time later on.

Production Counts. It isn't so many a number of trees in the orchard that count. It's the trees that produce.

Benefits of Sprays Out. A good spray used not only saves the fruit but also makes it more palatable and more tender.

Helps Fish Flavor. You will improve the flavor of fish if you apply the following to the fish when it is fresh.

Horticultural Hints

CULTIVATION IS IMPORTANT

Fruit Trees Need Attention Same as Any Other Growing Crop to Have Mature.

It is just as essential to cultivate fruit trees as any other growing crop. Sometimes the trees are plowed in the spring and left the rest of the year without any further care, so far as cultivation is concerned. An exception is where a cultivated crop is growing between the trees. When deep plowing, a cultivated crop may be grown between the trees as long as it does not interfere with the main crop. The same method will apply to fruit trees, such as the main crop, so far as the soil further away from the trees and the trees are well as bearing cases growing a spruce crop among the trees at all writes Dr. C. Mouring in the Kansas Farmer, Mail and Review.

A soil that is well cultivated will accomplish the following things: 1—Keep such more moisture, holding rains and snow; 2—Observe the structure; 3—Keep down grass and weeds; 4—Aerate the soil, in part by air circulation, which is necessary to the life and development of the roots.

The best cultivation in the spring should be four or five inches deep. In winter, however, available soil is at least. Be careful not to kill the trees.

In case your trees are growing in the yard, where it is not profitable to use horse power to cultivate, a spade, shovel, or hoe may be used. When a hand tool is used, loosen the soil under the tree and at least a foot from the trunk at all writes Dr. C. Mouring in the Kansas Farmer, Mail and Review.

The cultivation should begin in early spring and continue until midsummer under normal conditions and during the first season of cultivation should be continued.

More Than Merely Lubrication

Seek This Also in Your Motor Oil—

Aristo is as near perfection purely as a lubricating film as science can produce today. All the facilities, all the expert chemists, all the latest and acknowledged best equipment that the Union Oil Company can gather together are employed in the production of **Aristo**. Great research laboratories at our plants are constantly trying all methods and all oils to be sure that none is better. **Aristo** forms a durable, fine film which penetrates and **lubricates** all the motor's moving parts in any weather and at every motor heat.

But you should look for more than this in motor oils.

"Carbons" Are Important

All oils deposit some carbonaceous residue in use, as all refineries know. But some deposit one kind, some another. One is **flinty-hard**. It attaches to pistons, cylinders, spark plugs and valves. It has a tendency to cling. And it acts as an abrasive, causing wear.

It becomes incandescent and pre-ignites the gas. It coats spark plugs, short-circuiting the spark. Its frequent accumulation around valves impairs compression.

Four motor troubles, familiar to all motorists at one time or another, follow.

The Other Kind

The little residue—a half to a third as much—comes from **Aristo** Motor Oil is of a different kind. It is soft and fluffy. Its tendency is not to cling, so most of it blows out with the exhaust.

Being softer than the motor's metals it can't cause wear. Motors run thousands of miles farther without cleaning. Spark plugs practically never foul.

Such oil used regularly means a more satisfactory, smoother-running, longer-lasting, less expensive car. This is most apparent after several thousand miles. For sale at all first-class garages and service stations.
